Storage performance tuning is easy as taught by Ray Lucchesi

Broomfield, Colo. – Most data centers struggle today installing and backing up ever-increasing amounts of data storage. Although the need for more storage seems insatiable current storage is often woefully under utilized. Poor storage performance often indicates when to purchase additional storage. However, storage performance tuning can and should be an ongoing activity and when done properly can lead to more controlled storage growth. Ray Lucchesi, President of Silverton Consulting (<http://www.silvertonconsulting.com>) will be discussing how to “Pump-up Array Performance” at Interop Conference April 30th in Las Vegas to show how easily one can improve storage array performance.

The secrets to better performing storage involve knowing the I/O workload and configuring storage to handle it effectively. Ray reveals how to buy performing storage at the best price, configure/tune storage for the best performance, and monitor I/O workloads for performance anomalies. In addition, Ray provides hints on how to improve database and email performance and will be available to answer any other questions on storage performance.

ABOUT Silverton Consulting, Inc. - Silverton Consulting is a Storage, Strategy & Systems consulting services company, based in the USA offering products and services to the data storage community.
